a
Real vs matched sets
Real complexes (fraction p < 0.05)
Matched random gene sets (fraction p < 0.05)
pooled: real vs random
H3a: 0.281 vs 0.281
H3b: 0.120 vs 0.116
b
Lineage scale effect
primary
+ NNMD, CasActivity
Spearman ρ (unit essentiality, lineage β)
c
H2 (exploratory), n = 109
H2 discoveries
rank 1: 40
rank ≤ 2: 66
exchangeable: 5.2 per rank
Rank of |t| among own 20 splits (1 = beats all)
d
Complex-specific, non-locus discoveries (34 units with the largest |t|)
H3a lineage
H3b driver / state
β (Chronos)
e
Never-expressed sets, fraction p < 0.05 (◆; H3a)
H3a
H3b
complex-specific
other, non-locus
locus
Discoveries (A)
f
Sensitivity survival per context (contexts with ≥ 3 discoveries; n in brackets)
screen-quality, complex-specific non-locus subset
screen-quality sensitivity (all discoveries)
GPD-tail sensitivity, p = max(p_perm, p)
Fraction of primary discoveries kept
